AT A GLANCE

Who I am

- Professional software developer with emphasis on web development, data transformation and integration.
- Mathematics PhD in geometry and differential equations.
- Experienced in data visualization and graphic/web design.

My Toolbox

- Perl, PHP, Java, Ruby, Python, C++
- HTML5, CSS3, Modern JavaScript
- MySQL, SQLite, PostgreSQL
- Linux, Git, Docker

WORK HISTORY

Software Engineer

Jan 2018– *Aurec, under contract to Geoscience Australia* Canberra

TODO

Software Engineer

May–Jan 2018 *CSIRO* Canberra

A six month position at the *High Resolution Plant Phenomics Centre*, developing software devoted to integrating and visualizing data for agriculture and plant science. My main focus was developing new software infrastructure to support time series data gathered from sensor networks:

- Streamlined data ingest processes and set up a new storage and aggregation solution using **InfluxDB**.
- Built a RESTful API to manage and retrieve time series data and metadata.
- Designed and developed a web dashboard on top of this API to provide diagnostics and basic data visualization. Used **JavaScript**, including the visualization libraries **D3.js** and **Plotly.js** along with modern web standards (**HTML5**, **SVG**, **CSS3** transitions, **ES6** modules, **Web Components**, etc.).

This work was integrated into an existing web application built on a **Linux+Apache+SQLite+PHP** stack. I also contributed to the development of other projects, including an internal business database built in **Java/Spring** and deployed using **Docker**.

Casual Sessional Academic

2015–2017 *Australian National University* Canberra

Teaching and marking for undergraduate classes in mathematics and astrophysics.

Software Developer

2006–2013 *Unisolve Pty Ltd* Melbourne

Full-stack development of web-based software, along with administration of associated systems and databases.

I worked on various large web applications, mostly built in **Linux+Apache+Perl**, using modern libraries including `Mason`, `DBIx::Class`, `Moose` and `Dancer`. They were typically backed by relational databases like **MySQL**, **PostgreSQL**, and **SQLite**, and regression-tested using `Test::More`. On the frontend, I used JavaScript (including libraries like **jQuery** and **Sencha/ExtJS** and the extensive use of AJAX) to create interactive user experiences.

Many of these applications were part of accounting and resource management systems for mid-sized companies, interfacing with older proprietary software; so I became proficient in data wrangling/**ETL**.

I was also involved in developing simple deployment architecture, writing scheduled processes to carry out heavier business logic and reporting tasks, and implementing automated backups; so I have extensive experience using shell scripts, cron jobs and daemons to automate systems.

Sessional Teaching Associate

2012 *Monash University* Melbourne

Teaching and marking for undergraduate engineering calculus.

Web Developer (Contractor)

2009–2010 *Ramble Communications* Melbourne

Front-end development and maintenance of small websites.

EDUCATION

Doctor of Philosophy (Mathematics) — 2013–2018 — *Australian National University* — Canberra

PhD Thesis: ***Geometric Flows of Diffeomorphisms***
Supervisor: Ben Andrews
Geometric flows hijack the physics of heat flow to study geometry: by making a mathematical analogy between "spikiness" and heat, we can deform poorly-understood spiky objects to simple smooth ones; and by understanding the mathematical properties of this deformation we can derive new knowledge about the spiky things we started with. In my thesis research, I applied this methodology to a previously unstudied class of flow.

Bachelor of Science Advanced (with Honours) — 2009–2012 — *Monash University* — Melbourne

Majors: Mathematics, Physics
Honours Thesis: *The Riemannian Penrose Inequality and the Inverse Mean Curvature Flow*
Supervisor: Gilbert Weinstein
The universe should weigh at least as much as the biggest black hole it contains, but the mathematical embodiment of this fact (the Penrose Inequality) is remarkably difficult to derive from general relativity: it took until 1999 for even a special case to be proven. This thesis was an exposition of the problem and its solution intended for a slightly less expert audience.

UNDERGRADUATE RESEARCH

Summer Vacation Research Scholarship — 2011–2012 — *Monash University* — Melbourne

Reading project on the problem of *minimal surfaces*: if you dip a wonky loop of wire in a bucket of soapy water, what is the shape of the resulting bubble? The techniques developed to study this problem are now ubiquitous in physics and geometry.

Mathematics Research Project — 2011 — *Monash University* — Melbourne

Reading project in *comparison geometry*, the quantitative study of how the familiar relationships of lengths and angles change when we work on a curved surface (or in a curved space).

Mathematics Research Project — 2010–2011 — *AMSI/Monash University* — Melbourne

Numerical investigation of *p*-adic zeta functions using the mathematical programming language PARI/GP. Culminated in a presentation at the CSIRO Big Day In.

OTHER EXPERIENCE

Some things don't come from work or school.

- Computational Mathematics/Visualization: as a spin-off from my thesis research, I combined numerical simulations of partial differential equations with my expertise in frontend web development to develop interactive visualizations of some geometric flows, which you can play with online at **a.carapetis.com/csf/** (**JavaScript** + **Canvas**) and **a.carapetis.com/diff_flow/** (**PixiJS**).
- My professional history has been concentrated on a few languages, but I have hobbyist experience with many others, including **Ruby**, **C++**, and **Haskell**
- Graphic design (free and small freelance projects) using **Inkscape** and **GIMP**
