### AT A GLANCE

#### Who I am

- Software developer with deep experience in web technologies, data manipulation and software systems integration.
- Mathematics PhD in geometry and differential equations. Also experienced in numerical simulation and modelling.

#### My Toolbox

- Python, Perl, JavaScript/ES6+, Java
- HTML5, CSS3, Browser APIs
- MySQL, SQLite, PostgreSQL
- Linux, AWS, Terraform, Docker, Git

### WORK HISTORY

#### Software Engineer

📅 Jan 2019– 🏢 under contract to **Geoscience Australia** 📍 Canberra

As the lead developer for the National Earthquake Alerts Centre, I am responsible for software systems that produce, store and disseminate information associated with earthquakes and other seismic events. I have:

- Continuously maintained and enhanced the earthquake alerts and analysis system, which is a mix of open-source, proprietary and bespoke software deployed on **AWS** using **Terraform**.
- Developed pipelines to ingest, transform and integrate various data sources.
- Architected and developed a custom data catalogue for the storage, quality control, and dissemination of earthquake-related data products of all kinds — from raw seismograms through to news articles. I built this system using **Python** on **AWS**, with geospatial indexing powered by **PostGIS**, with an interactive frontend built on Web Components.
- Integrated the USGS ShakeMap modelling software into our automated workflow, allowing the Centre to rapidly estimate and visualize the areas most effected by an earthquake. This included a lot of custom configuration and the addition of several new features, which I contributed back to the USGS repository.

#### Software Engineer

📅 May–Dec 2018 🏢 **CSIRO** 📍 Canberra

A fixed-term position at the *High Resolution Plant Phenomics Centre* developing software for agriculture and plant science. My main focus was developing infrastructure to exploit time series data gathered from sensor networks:

- Streamlined data ingest processes and set up a new storage and aggregation solution using **InfluxDB**.
- Built a REST API to manage and retrieve time series data and metadata.
- Designed and developed a web dashboard on top of this API to provide diagnostics and basic data visualization. Used **JavaScript**, including the visualization libraries **D3.js** and **Plotly.js** along with modern web standards (**HTML5**, **SVG**, **CSS3** transitions, **ES** modules, **Web Components**, etc.).

This work was integrated into an existing web application built on a **Linux+Apache+SQLite+PHP** stack. I also contributed to the development of other projects, including an internal business database built in **Java/Spring** and deployed using **Docker**.

#### Casual Sessional Teacher

📅 2015–2017 🏢 **Australian National University** 📍 Canberra

Teaching and marking for undergraduate classes in mathematics and astrophysics.

#### Software Developer

📅 2006–2013 🏢 **Unisolve Pty Ltd** 📍 Melbourne

Design and full-stack development of web applications for various clients, along with administration of associated systems and databases.

I worked on various large web applications, mostly built on **Linux+Apache+Perl** and backed by **MySQL** or **PostgreSQL**. On the frontend, I used JavaScript to create interactive user experiences. Many of these applications were part of accounting and resource management systems that interfaced with older proprietary software; so I became proficient in systems integration and data munging/wrangling/ETL.

I was also involved in developing simple deployment architecture, scheduled processing/reporting tasks, and automated backups; so I have extensive experience using shell scripts, cron jobs and daemons to automate systems.

## WORK HISTORY (CONTINUED)

Casual Sessional Teacher ----- 📅 2012 🏫 Monash University 📍 Melbourne  
Teaching and marking for undergraduate engineering calculus.

## EDUCATION

Doctor of Philosophy (Mathematics) ----- 📅 2013–2018 🏫 Australian National University 📍 Canberra

PhD Thesis: [Geometric Flows of Diffeomorphisms](#)

Supervisor: Ben Andrews

Geometric flows hijack the physics of heat flow to study geometry: by making a mathematical analogy between "spikiness" and heat, we can deform poorly-understood spiky objects to simple smooth ones; and by understanding the mathematical properties of this deformation we can derive new knowledge about the spiky things we started with. In my thesis research, I applied this methodology to a previously unstudied class of flow.

Bachelor of Science Advanced (with Honours) ----- 📅 2009–2012 🏫 Monash University 📍 Melbourne

Majors: Mathematics, Physics

Honours Thesis: *The Riemannian Penrose Inequality and the Inverse Mean Curvature Flow*

Supervisor: Gilbert Weinstein

The universe should weigh at least as much as the biggest black hole it contains, but the mathematical embodiment of this fact (the Penrose Inequality) is remarkably difficult to derive from general relativity: it took until 1999 for even a special case to be proven. This thesis was an exposition of the problem and its solution intended for a slightly less expert audience.

## UNDERGRADUATE RESEARCH

Summer Vacation Research Scholarship ----- 📅 2011–2012 🏫 Monash University 📍 Melbourne

Reading project on the problem of *minimal surfaces*: if you dip a wonky loop of wire in a bucket of soapy water, what is the shape of the resulting bubble? The techniques developed to study this problem are now ubiquitous in physics and geometry.

Mathematics Research Project ----- 📅 2011 🏫 Monash University 📍 Melbourne

Reading project in *comparison geometry*, the quantitative study of how the familiar relationships of lengths and angles change when we work on a curved surface (or in a curved space).

Mathematics Research Project ----- 📅 2010–2011 🏫 AMSI/Monash University 📍 Melbourne

Numerical investigation of  $p$ -adic zeta functions using the mathematical programming language PARI/GP. Culminated in a presentation at the CSIRO Big Day In.

## OTHER EXPERIENCE

Some things don't come from work or school.

- Computational Mathematics/Visualization: as a spin-off from my thesis research, I combined numerical simulations of partial differential equations with my expertise in frontend web development to develop interactive visualizations of some geometric flows, which you can play with online at [a.carapetis.com/csf/](http://a.carapetis.com/csf/) (JavaScript + Canvas) and [a.carapetis.com/diff\\_flow/](http://a.carapetis.com/diff_flow/) (PixiJS).
- My professional history has been concentrated on a few languages, but I have hobbyist experience with many others, including Ruby, C++, TypeScript and Haskell.
- Graphic design (free and small freelance projects) using Inkscape and GIMP.
